

# Filter MAGIC - C

We are putting on sale a new type of filter that is structurally different from all the existing filters used so far in vehicle lpg reconstruction. In standard filters, the filter pad is saturated with impurities (especially oil) to leak into the hoses leading to the injectors and to clog it. Then it is necessary to change the entire hose with the insert.

The new filter uses a centrifugal-gravitational effect before self-gas filtration, resulting in the deposition of heavy impurities in the separation chamber. Only then is gas purged by passage through the filter insert. The filter has a better filtration capability, with a longer life and resistance of the filter pad against penetration of impurities and the injection of injectors even when the filter insert leaks.

**This unique principle has these advantages over classic filters:**

- centrifugal separation and subsequent filtration
- no leaks and deposits in hoses and injectors will result in leakage of the filter cartridge
- separation of heavy dirt in the separation chamber without clogging the filter insert
- protects injectors and thus supports their correct operation and extends life
- the possibility of several outlets, also serves as a lpg distributor for injectors
- possibility of fitting with a filament insert
- increases the life of the filter pad
